

## **Arestin® Periodontal Treatment Post-op Instructions**

### **What is it?**

Arestin® is a bioresorbable gel containing minocycline (a tetracycline derivative) microspheres. It has been FDA approved for treatment of gum disease after a deep cleaning procedure known as scaling and root planing.

### **How does it work on gum disease?**

When placed in a periodontal pocket, Arestin® maintains a high-level of antibiotic right at the gum disease site without exposing the rest of the body to antibiotics. This allows treatment using one-hundredth the usual pill-form dose. It directly fights the gum disease infection for 14 days.

### **How do I get the best results from my treatment with Arestin®?**

- Wait 12 hours after your treatment before brushing teeth
- Avoid touching the treated areas
- Wait 10 days before using floss, toothpicks, or other devices designed to clean between the treated teeth (your hygienist will show you which areas to avoid)
- Avoid foods for 1 week that could hurt your gums
- Don't chew gum or eat sticky foods.
- After 10 days, resume cleaning between the treated teeth on a daily basis.

Remember, you must do your part. After completion of your Arestin® therapy, if you don't brush at least 2 times per day and floss every day, then any dental treatment of your gum disease will not work effectively.
